

WARNER ROOFING and CONSTRUCTION

# COMMON ROOFING SHINGLES

The Pacific Northwest is truly four-season territory. With rain, snow, wind, sun, and ice - sometimes in the same week - our roofs take a beating during the year. Here are a few examples of the most common roof types and how they handle the weather.

## ARCHITECTURAL SHINGLES

A vast improvement over 3-tab shingles, these can be made in several different styles and colors. They also last much longer than 3-tab, up to 50 years. They are easy to maintain and are among the least expensive roof coverings on the market.

## CEDAR SHAKE SHINGLES

A very distinct look, perfect for a lakeside cabin or similar architecture. Naturally strong and look good after weathering. They are more expensive than architectural shingles and require specific installation. Maintenance is also key to get the most out of these shingles.

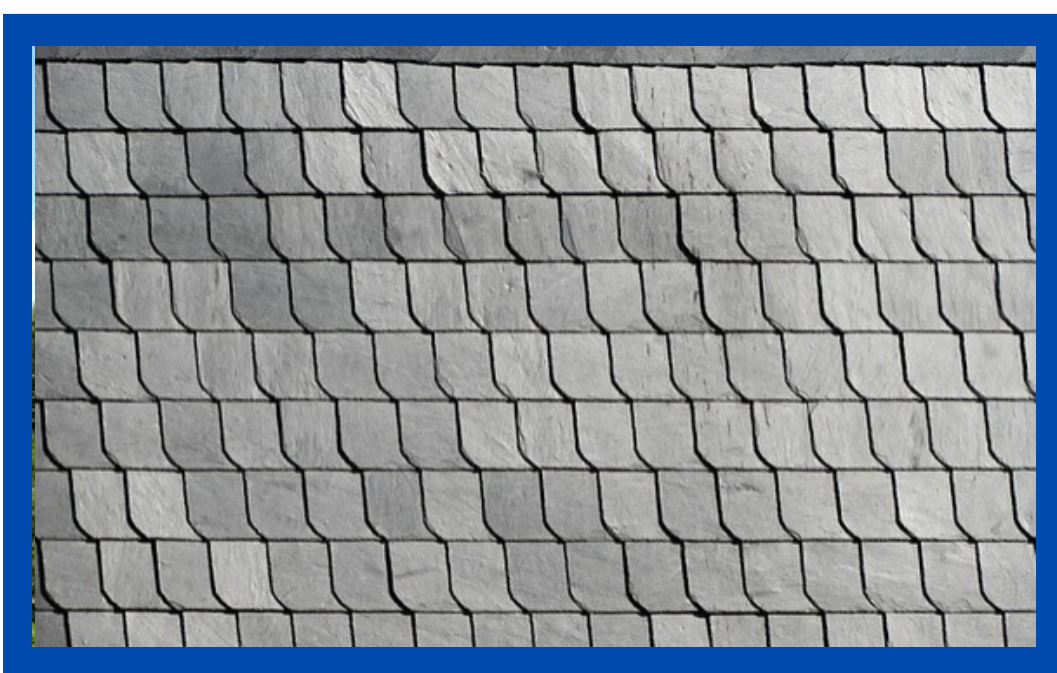

## CLAY TILES

Longer lasting than asphalt or cedar shingles without as much maintenance, these tiles are made to handle the sun as well as sudden downpours. With a lifespan of 50 years, tiles are very heavy and roof structures may need more support to handle the extra weight.

## METAL ROOFING

One of the longest lasting roofing materials on the market, but you'll pay for that longevity. Becoming more popular in residential use, they can be made with different profiles and a wide variety of colors. Resisting moss, algae, rust, and more, maintenance is easy.

## SLATE TILES

The Rolls Royce of roof covering, slate has a cool, classic feel and will last a century. Like metal roofing, you'll pay for that peace of mind though. Slate can be manufactured in many different designs, but because of its weight, can weight two to three times as much as other materials and can break during installation if not handled properly.

Whether it's a re-roof, a complete roof replacement, or roof for a new home, the material won't matter if it's installed correctly. That's why it's so important to hire a professional roofing contractor that understands the differences in asphalt shingles, metal roofing, and slate shingles - and how to install each product.

Warner Roofing and Construction has been working in Clark County since 1992, installing, repairing, and maintaining all parts of the roofing system.
